Software engineer with two years on a large React and TypeScript micro-frontend platform in the defence sector. Mostly frontend, with backend and deployment work when the project needed it.

EXPERIENCE

Software Engineer, NCS Jul 2024 – Present

Logistics platform for a government defence client, built as React micro-frontends over Spring Boot services.

- Build pages and components for three of the platform's micro-frontend apps in React and TypeScript (Module Federation, Redux Toolkit, Zustand, Ant Design), on top of the team's shared Storybook component library.
- Developed a Spring Boot file-validation service for large, multi-file data sets. Its rules were far more conditional than the first version's, so split the original data model into smaller pieces that each rule could compose.
- Worked out the read and validation order and added batch parallelism to meet the service's performance requirements, and updated the architecture documentation with the architect.
- Set up servers and wrote the setup and deployment guides for the platform's applications; deployed and debugged on client sites.
- Use the client's approved on-premise AI coding tools for tests and boilerplate (CRUD, model and view-model layers), and maintain the repository's agent rules and context files.
- Handle production bugs and review teammates' code.

Software Engineer Intern, NCS May – Aug 2023

Wrote JUnit and Mockito tests for Spring Boot modules ahead of a migration to a new architecture.

Software Engineer Intern, Continental Automotive Singapore Jan – Apr 2023

Built an Angular dashboard for monitoring bus-driver health and performance, with engineers in Germany.

PROJECTS

Spendulu React, TypeScript, Vite, Pyodide, Web Workers · built with Claude Code

Personal-finance web app for Singapore, where banks offer no consumer API. Reads PDF statements from five local issuers and runs the Python parsing engine in a Web Worker, so statements never leave the device.

browhen Python, SQLAlchemy, Alembic, Postgres, Cloud Run, GitHub Actions · built with Claude Code

Telegram bot that finds a day a group chat can meet. The database enforces one open plan per chat, tests check the models against the migrations, and CI runs on every push.

LaparoLymph Unity, C#, VR

Final-year project with Duke-NUS Medical School and Singapore General Hospital: a VR trainer for a rare pelvic surgery, paired with a 3D-printed haptic training box. Surgeons reported higher confidence after user testing. Team of seven.

EDUCATION

Singapore University of Technology and Design, B.Eng, Computer Science and Design 2020 – 2024

NUS-ISS, Graduate Certificate, Designing Modern Software Systems 2025

Professional Scrum Developer I (PSD I)

SKILLS

Frontend: React, TypeScript, JavaScript, HTML/CSS, Micro-frontends (Module Federation), Ant Design, Storybook, Angular
Backend: Java, Spring Boot, Python, Ruby on Rails, SQL, REST APIs, Microservices
Delivery: Git, CI/CD, JUnit, Mockito, Agile/Scrum, Jira
Other: Unity, C#
Languages: English, Mandarin
Interests: Bouldering, diving, snowboarding, dance
